

Introducing everything you need to save lives in one unique kit.

PTENSYS Carts house multiple Kit bags depending on your requirements. The items in our kits are designed to address severe trauma, these include: haemorrhage, airway compromise, pneumothorax, and hypothermia. This is essential in places that attract large numbers of people, such as transport hubs or any pre-planned mass gathering event, where there is potential to outstrip on-site resources and to ensure you have the most appropriate trauma care kit.

Categorically, nobody before us in the emergency medical industry has designed a trauma kit that folds out to allow side-by-side working with added extendable floodlights. This unique feature takes care of poor visibility and frees the hands of rescuers while bringing some order to a chaotic situation.

Each Kit bag is designed to service at least four patients and most of the materials within it are applicable for basic skill level use, especially bleed control.
